

Is Sharing Caring?

Elucidating the Effects of the
Presence of CRISPR-Cas Systems
on Rates of Horizontal Gene
Transfer Using Network Analysis

Siddharth Reed
MolBiol 4C12 Thesis

Golding Lab,
Biology Department,
McMaster University

March 29, 2019

Table of Contents

1. CRISPR-Cas systems
2. Horizontal Gene Transfer
3. Phylogenomic Networks
4. Do CRRISPR Systems Affect Horizontal Gene Transfer?
5. My Project

CRISPR-Cas systems

What Are They?

What Are They?

- Adaptive Bacterial Immune System

What Are They?

- Adaptive Bacterial Immune System
- Protects against foreign DNA

What Are They?

- Adaptive Bacterial Immune System
- Protects against foreign DNA
- Requires Cas proteins and CRISPR loci

Diversity & Ubiquity

Diversity & Ubiquity

- 45% of bacteria have CRISPR loci ($n = 6782$)²

Diversity & Ubiquity

- 45% of bacteria have CRISPR loci ($n = 6782$)²
- 3 Main Types, multiple subtypes³

Diversity & Ubiquity

- 45% of bacteria have CRISPR loci ($n = 6782$)²
- 3 Main Types, multiple subtypes³
- CRISPR arrays represent unique life history of an organism

Diversity & Ubiquity

- 45% of bacteria have CRISPR loci ($n = 6782$)²
- 3 Main Types, multiple subtypes³
- CRISPR arrays represent unique life history of an organism
- 11% – 28% are false or orphaned CRISPR loci⁴

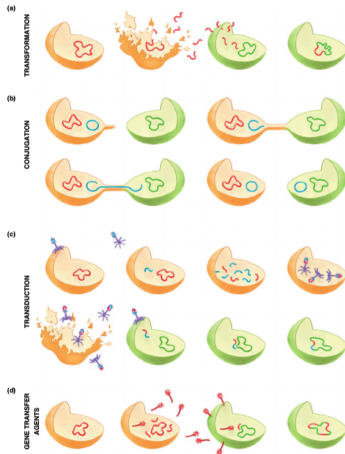

Biotech Application

Biotech Application

Horizontal Gene Transfer

Mechanisms

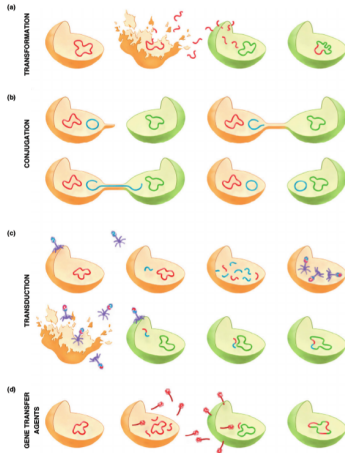

Mechanisms

- Conjugation: Transfer of DNA through cell-cell connections⁶

Mechanisms

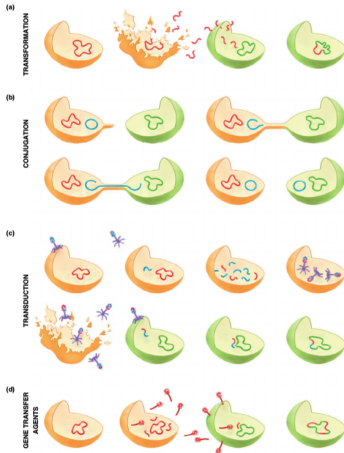

- Conjugation: Transfer of DNA through cell-cell connections⁶
- Transformation: Incorporation of free-floating DNA into the genome⁶

Mechanisms

- Conjugation: Transfer of DNA through cell-cell connections⁶
- Transformation: Incorporation of free-floating DNA into the genome⁶
- Transduction: Transfer of DNA through phage⁶

Mechanisms

- Conjugation: Transfer of DNA through cell-cell connections⁶
- Transformation: Incorporation of free-floating DNA into the genome⁶
- Transduction: Transfer of DNA through phage⁶
- **CRISPR-Cas directly affects Transduction and Transformation⁶**

Rate Influencing Factors

Rate Influencing Factors

- Amount of exogenous DNA/cell density/phage density

Rate Influencing Factors

- Amount of exogenous DNA/cell density/phage density
- Selective pressures

Rate Influencing Factors

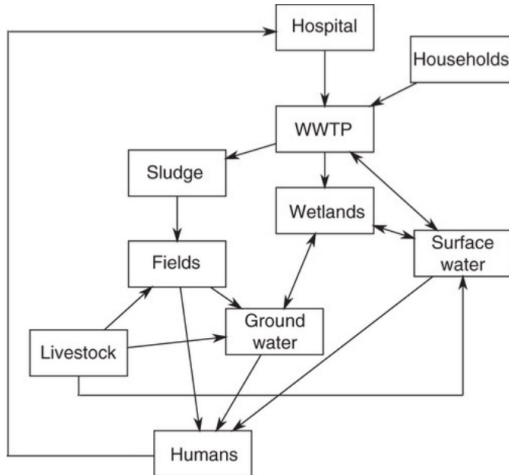

- Amount of exogenous DNA/cell density/phage density
- Selective pressures
- Metabolic costs

Rate Influencing Factors

- Amount of exogenous DNA/cell density/phage density
- Selective pressures
- Metabolic costs
- Sequence compatibility

Applications

Applications

Phylogenomic Networks

What is A Network?

What is A Network?

- Useful mathematical abstraction of real world system

What is A Network?

- Useful mathematical abstraction of real world system
- Nodes can have attributes

What is A Network?

- Useful mathematical abstraction of real world system
- Nodes can have attributes
- Directed or Undirected Edges

What is A Network?

- Useful mathematical abstraction of real world system
- Nodes can have attributes
- Directed or Undirected Edges
- Weighted or Unweighted Edges

Prokaryotic “Net of Life”

Prokaryotic “Net of Life”

Construction

1. Parametric methods

2. Phylogenetic methods

2a. Implicit phylogenetic methods

2b. Explicit phylogenetic methods

Do CRRISPR Systems Affect Horizontal Gene Transfer?

Yes

CRISPR Cost Complexity

CRISPR Cost Complexity

- Cost tradeoff factors:

CRISPR Cost Complexity

- Cost tradeoff factors:
 - Metabolic maintenance¹

CRISPR Cost Complexity

- Cost tradeoff factors:
 - Metabolic maintenance¹
 - Environmental pressures¹³

CRISPR Cost Complexity

- Cost tradeoff factors:
 - Metabolic maintenance¹
 - Environmental pressures¹³
 - Off-target effects (autoimmune)¹⁴

CRISPR Cost Complexity

- Cost tradeoff factors:

 - Off-target effects (autoimmune)¹⁴
 - Anti-CRISPR systems³
 - Phage virulence/density³

CRISPR Cost Complexity

- Cost tradeoff factors:
 - Metabolic maintenance¹
 - Environmental pressures¹³
 - Off-target effects (autoimmune)¹⁴
 - Anti-CRISPR systems³
 - Phage virulence/density³
 - Prophage abundance¹⁵

Curbing CRISPR Cost

Curbing CRISPR Cost

- CRISPRs themselves can be transferred \implies population level immunity¹⁶

Curbing CRISPR Cost

- CRISPRs themselves can be transferred \implies population level immunity¹⁶
- Selective CRISPR inactivation¹

Curbing CRISPR Cost

- CRISPRs themselves can be transferred \implies population level immunity¹⁶
- Selective CRISPR inactivation¹
- CRISPR can enhance transduction-mediated HGT¹⁵

Previous Findings

Previous Findings

- Gophna et al. (2015) found no relation between the presence of CRISPR systems and HGT over short evolutionary timescales¹⁷

Previous Findings

- Gophna et al. (2015) found no relation between the presence of CRISPR systems and HGT over short evolutionary timescales¹⁷
 - Assume all singletons arose from HGT

Previous Findings

- Gophna et al. (2015) found no relation between the presence of CRISPR systems and HGT over short evolutionary timescales¹⁷
 - Assume all singletons arose from HGT
 - Used GC% to identify HGT

Previous Findings

- Gophna et al. (2015) found no relation between the presence of CRISPR systems and HGT over short evolutionary timescales¹⁷
 - Assume all singletons arose from HGT
 - Used GC% to identify HGT
- Contradicted by a former undergraduate thesis student

Previous Findings

- Gophna et al. (2015) found no relation between the presence of CRISPR systems and HGT over short evolutionary timescales¹⁷
 - Assume all singletons arose from HGT
 - Used GC% to identify HGT
- Contradicted by a former undergraduate thesis student
 - Can see inhibitory effects of CRISPR on HGT over short evolutionary time scales

Previous Findings

- Gophna et al. (2015) found no relation between the presence of CRISPR systems and HGT over short evolutionary timescales¹⁷
 - Assume all singletons arose from HGT
 - Used GC% to identify HGT
- Contradicted by a former undergraduate thesis student
 - Can see inhibitory effects of CRISPR on HGT over short evolutionary time scales
 - Higher gene indel rates for CRISPR containing genera than non-CRISPR containing outgroups

My Project

Hypothesis

Null Hypothesis

Bacterial strains or genera with known CRISPR systems will show no significant differences in network statistics compared to those strains or genera without known CRISPR systems.

Hypothesis

Null Hypothesis

Bacterial strains or genera with known CRISPR systems will show no significant differences in network statistics compared to those strains or genera without known CRISPR systems

Alternative Hypothesis

Bacterial strains or genera with known CRISPR systems will show a significant difference in at least 1 network statistic compared to those strains or genera without known CRISPR systems.

Objectives

Objectives

Within Network Comparisons

For genera with CRISPR containing strains, compare the node statistics of CRISPR-containing strain to non-CRISPR-containing strains.

Objectives

Within Network Comparisons

For genera with CRISPR containing strains, compare the node statistics of CRISPR-containing strain to non-CRISPR-containing strains.

Gene InDel Rates vs. Network Statistics

Compare gene InDel rates to node/network statistics for CRISPR-containing and non-CRISPR-containing strains/genera.

Network Statistics

Network Statistics

- **Average Node Degree:** $\frac{1}{|N_u|} \sum_{uv} w_{uv}$ where N_u is the set of nodes incident to u

Network Statistics

- **Average Node Degree:** $\frac{1}{|N_u|} \sum_{uv}^{N_u} w_{uv}$ where N_u is the set of nodes incident to u
- **Average Edge Weight:** $\frac{1}{N_c} \sum_i w_i$, The average edge weight for all nodes with CRISPR or without CRISPR

Network Statistics

- **Average Node Degree:** $\frac{1}{|N_u|} \sum_{uv}^{N_u} w_{uv}$ where N_u is the set of nodes incident to u
- **Average Edge Weight:** $\frac{1}{N_c} \sum_i w_i$, The average edge weight for all nodes with CRISPR or without CRISPR
- **Node Clustering Coefficient:** $\frac{1}{k_u(k_u-1)} \sum_{vw}^{T(u)} (w_{uw} w_{vw} w_{uv})^{\frac{1}{3}}$
where $T(u)$ is the set of triangles containing u ¹⁸

Network Statistics

- **Average Node Degree:** $\frac{1}{|N_u|} \sum_{uv}^{N_u} w_{uv}$ where N_u is the set of nodes incident to u
- **Average Edge Weight:** $\frac{1}{N_c} \sum_i w_i$, The average edge weight for all nodes with CRISPR or without CRISPR
- **Node Clustering Coefficient:** $\frac{1}{k_u(k_u-1)} \sum_{vw}^{T(u)} (w_{uw} w_{vw} w_{uv})^{\frac{1}{3}}$ where $T(u)$ is the set of triangles containing u ¹⁸
- **Node Assortativity:** $\frac{Tr(M) - ||M^2||}{1 - ||M^2||}$ Where M is the mixing matrix of a given attribute and $||M||$ is the sum of all elements of M .¹⁹

Network Statistics

- **Average Node Degree:** $\frac{1}{|N_u|} \sum_{uv}^{N_u} w_{uv}$ where N_u is the set of nodes incident to u
- **Average Edge Weight:** $\frac{1}{N_c} \sum_i w_i$, The average edge weight for all nodes with CRISPR or without CRISPR
- **Node Clustering Coefficient:** $\frac{1}{k_u(k_u-1)} \sum_{vw}^{T(u)} (w_{uw} w_{vw} w_{uv})^{\frac{1}{3}}$ where $T(u)$ is the set of triangles containing u ¹⁸
- **Node Assortativity:** $\frac{Tr(M) - ||M^2||}{1 - ||M^2||}$ Where M is the mixing matrix of a given attribute and $||M||$ is the sum of all elements of M .¹⁹
- **Node Eigenvector Centrality:** $\frac{N-1}{\sum_v d(u,v)}$ where $d(x, y)$ is the length of the shortest path $v \rightarrow u$.²⁰

Network Statistics

- **Average Node Degree:** $\frac{1}{|N_u|} \sum_{uv}^{N_u} w_{uv}$ where N_u is the set of nodes incident to u
- **Average Edge Weight:** $\frac{1}{N_c} \sum_i w_i$, The average edge weight for all nodes with CRISPR or without CRISPR
- **Node Clustering Coefficient:** $\frac{1}{k_u(k_u-1)} \sum_{vw}^{T(u)} (w_{uw} w_{vw} w_{uv})^{\frac{1}{3}}$ where $T(u)$ is the set of triangles containing u ¹⁸
- **Node Assortativity:** $\frac{Tr(M) - ||M^2||}{1 - ||M^2||}$ Where M is the mixing matrix of a given attribute and $||M||$ is the sum of all elements of M .¹⁹
- **Node Eigenvector Centrality:** $\frac{N-1}{\sum_v d(u,v)}$ where $d(x,y)$ is the length of the shortest path $v \rightarrow u$.²⁰
- **Network Modularity:** $Q = \frac{1}{2m} \sum_{uv}^W [W_{uv} - \frac{k_u k_v}{2m}] \delta(u,v)$ where m is the total weight of all edges, k_u is the degree of u and $\delta(u,v)$ is 1 if u and v both have or do not have CRISPR systems and 0 otherwise. $Q \in [-1, 1]$ ²¹

Limitations & Caveats

Limitations & Caveats

- **Ignored Singletons:** Genes that did not cluster into any families were ignored from future steps, but may have still represented horizontally transferred genes

Limitations & Caveats

- **Ignored Singletons:** Genes that did not cluster into any families were ignored from future steps, but may have still represented horizontally transferred genes
- **Ignored Some Gene Families:** For time considerations, only 1500 gene trees were generated for each genus

Limitations & Caveats

- **Ignored Singletons:** Genes that did not cluster into any families were ignored from future steps, but may have still represented horizontally transferred genes
- **Ignored Some Gene Families:** For time considerations, only 1500 gene trees were generated for each genus
- **Significance Testing:** Samples are not necessarily independent in a network, further node statistics can only be tested for genera with > 20 CRISPR and non-CRISPR OTUs.

Limitations & Caveats

- **Ignored Singletons:** Genes that did not cluster into any families were ignored from future steps, but may have still represented horizontally transferred genes
- **Ignored Some Gene Families:** For time considerations, only 1500 gene trees were generated for each genus
- **Significance Testing:** Samples are not necessarily independent in a network, further node statistics can only be tested for genera with > 20 CRISPR and non-CRISPR OTUs.
- **Taxonomic Mistakes:** Inconsistencies in taxonomic labelling can result in ignored or misplaced OTUs.

Limitations & Caveats

- **Ignored Singletons:** Genes that did not cluster into any families were ignored from future steps, but may have still represented horizontally transferred genes
- **Ignored Some Gene Families:** For time considerations, only 1500 gene trees were generated for each genus
- **Significance Testing:** Samples are not necessarily independent in a network, further node statistics can only be tested for genera with > 20 CRISPR and non-CRISPR OTUs.
- **Taxonomic Mistakes:** Inconsistencies in taxonomic labelling can result in ignored or misplaced OTUs.
- **Multifurcation Error:** Some species trees contained multifurcations, which were resolved randomly to generate a bifurcating tree. Estimating this error by examining variance over different resolutions is possible.

Possible Future Directions

Possible Future Directions

- **Inferring direction:** Directed networks have a host of available analytic tools undirected networks do not

Possible Future Directions

- **Inferring direction:** Directed networks have a host of available analytic tools undirected networks do not
- **Gene function analysis:** Considering the transfer dynamics of different functional classes of genes

Possible Future Directions

- **Inferring direction:** Directed networks have a host of available analytic tools undirected networks do not
- **Gene function analysis:** Considering the transfer dynamics of different functional classes of genes
- **Studying movement of CRISPR systems:** Studying how frequently CRISPR systems themselves are transferred from arrays, cas genes

Possible Future Directions

- **Inferring direction:** Directed networks have a host of available analytic tools undirected networks do not
- **Gene function analysis:** Considering the transfer dynamics of different functional classes of genes
- **Studying movement of CRISPR systems:** Studying how frequently CRISPR systems themselves are transferred from arrays, cas genes
- **Intergenic comparisons:** Combine any set of fasta files for OTUs for analyzing transfer dynamics

Possible Future Directions

- **Inferring direction:** Directed networks have a host of available analytic tools undirected networks do not
- **Gene function analysis:** Considering the transfer dynamics of different functional classes of genes
- **Studying movement of CRISPR systems:** Studying how frequently CRISPR systems themselves are transferred from arrays, cas genes
- **Intergenic comparisons:** Combine any set of fasta files for OTUs for analyzing transfer dynamics
- **Continuous CRISPR activity:** Labelling nodes by estimated CRISPR activity (array length, transcriptomic data, etc.)

Possible Future Directions

- **Inferring direction:** Directed networks have a host of available analytic tools undirected networks do not
- **Gene function analysis:** Considering the transfer dynamics of different functional classes of genes
- **Studying movement of CRISPR systems:** Studying how frequently CRISPR systems themselves are transferred from arrays, cas genes
- **Intergenic comparisons:** Combine any set of fasta files for OTUs for analyzing transfer dynamics
- **Continuous CRISPR activity:** Labelling nodes by estimated CRISPR activity (array length, transcriptomic data, etc.)
- **Considering bacterial ecology and environments:** Consider geographically close OTUs or differences between networks due to environmental factors
